

MINING GOLD IN ROȘIA MONTANĂ

CYANIDE AND GOLD MINING: THE FACTS

95% of all gold production worldwide uses cyanide – it is one of the few chemical agents that dissolves gold efficiently.

Cyanide is found in things we use every day like table salt, fabrics, coffee, apricots, plums and lima beans.

When in a solution, cyanide is naturally broken down by sunlight alone.

EU standards are 10PPM for cyanide content of runoff water from mining. RMGC will operate at a max of 5-7PPM.

N. America/Australia limits are 50PPM

*PPM = Parts Per Million
